

LAB 5

Exercise:

1. In the DOS Batch Programming what does @ECHO OFF means?

The ECHO-ON and ECHO-OFF commands are used to enable and disable the echoing, or displaying on the screen, of characters entered at the keyboard. If echoing is disabled, input will not appear on the terminal screen as it is typed.

2. What Command you use to take input in Batch Programming?

Command:

```
set /p variable=[string]
```

3. Write the command to rename NED.bat file to BCIT.bat file?

Command:

```
ren NED.bat BCIT.bat
```

Q: How would you open a Website and a folder in your PC simultaneously with the same batch file?

To open a website and a folder at the same time with a batch file, you would need to use the start command. The start command allows you to open a new window with a specified program or file.

Here is an example of how you could use the start command to open a website and a folder at the same time with a batch file:

```
start chrome www.example.com
```

```
start explorer "C:\Myfolder"
```

In the example above, the start command is used to open the Chrome web browser and navigate to the specified website. Then, the start command is used again to open the Windows Explorer and navigate to the specified folder.

Note that the start command may not work on all versions of Windows, so you may need to use a different command to open a program or file in a new window. For more information about using the start command and other ways to open programs and files from a batch file, you can refer to the documentation for the start command or search online for more information.
